[c1] Methods and system for facilitating integration of prepaid PIN disbursement services with retail POS software. By which retail POS system references additional computers to determine and assign appropriate PIN and thus printing appropriate PIN on customer receipt for use at retailer's private label World Wide Website. With this system, typical cards representing specific monetary denominations are assigned and printed with SKUs that match denomination printed on the cards. These SKUs provide access to specific PIN databases. The PIN databases are grouped into corresponding denominations "Buckets" in association with the SKUs represented denominations. The appropriate PIN "bucket" sends PIN to POS to be printed on customer receipt for use as access key to services at retailer's private label World Wide Website.
